The aromatic compound (of a specified formula) can be used to increase alpha-gleerophosphate dehydrogenase (GPDH) levels, at levels which do not significantly modify cardidac GPDH levels and are indicated in the treatment of obesity. The compound also lower total plasma cholesterol and triglyceride levels and can be used as antipapertriglycerideemic agents. The compound may also be used for treating atherosclerosis and may be indicated in thyroid hormone replacement therapy in patients with compromised cardiac function. Sequences and any 15 and 1

The DNA can be used to make the hormone receptor proteins and functional modified forms in quantities not previously possible. The receptor proteins can be used to screen cpds, for receptor-agonist or receptor-antagonist activity. They can also be used in diagnostic asset.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        Recombinant DNA encoding hormone recpetors comprising glucocorticoid, mineralocorticoid, and novel hormone receptors

The DNA can be used to make the hormone receptor proteins and functional modified forms in quantities not previously possible. The receptor proteins can be used to screen cpds. for receptor-agonist or receptor-antagonist activity. They can also be used in diagnostic assays
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Sequence
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              Claim

                                                                                                                                                                                                                                                                                                     This is the amino acid sequence of a mutant nuclear glucocorticoid CC receptor (NGR), especially mutated in the region encoding the ligand CC binding domain (LBD), such that the activity of the receptor is induced CC more strongly by a synthetic glucocorticoid ligand than by a natural CC glucocorticoid ligand. The mutation is a point mutation in the coding Sequence (a translition mutation) generated by site-directed mutagenesis. This causes a replacement of the Ile residue at position 747 with a Thr CC This causes a replacement of the Ile residue at position 747 with a Thr CC The mutant coding sequence is used to generate a fusion protein CC comprising a protein whose activity is to be regulated by and fused to the NGR sequence. The protein is preferably a recombinase, especially the Cre recombinase from bacteriophage P1 (see AAV05702). The sequence cencoding the fusion protein, and vectors containing it, are used to treat cells either ex vivo or in vitro for use in gene therapy. Vectors containing and expressing the protein allow the transfer of heterologous genes to the cells genome by recombinase-directed recombination at loxp sites. By using a mutated LBD, normal physiological levels of the cligand will not induce recombination. This requires an increased level of

The aromatic compound (of a specified formula) can be used to increase alpha-glcerophosphate dehydrogenase (GPDH) levels, at levels which do not significantly modify cardiac GPDH levels and are indicated in the treatment of obesity. The compound also lower total
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        plasma cholesterol and triglyceride levels and can be used as anti-
hypertriglyceridaemic agents. The compound may also be used for treating
atherosclerosis and may be indicated in thyroid hormone replacement
therapy in patients with compromised cardiac function. Sequences

                                                                                                                                 Matches 261;
                                                                                                                                                                                                                         site in chromatin using the fluorescently-labelled GR. This provides the direct opportunity to visualise receptor/target interactions and can be used to screen for ligands that activate gene targetting or translocation of steroid receptors in the nucleus of a mammalian cell.
                                                                                                                                                                                                                                                                                          A fusion protein (AAW17789) comprises jellyfish green fluorescent protein (GFP) fused to rat glucocorticoid receptor (GR) via a Gly-Ala repeat linker. The GFP moiety contains an S65T substn. and the GR has a C656S substn. that humanises the protein and increases binding affinity for its ligand. Cell line 3134 (APCC CRL-119988), contg. a number of steroid receptor response elements in array, is used to visualise directly the interaction of GR and its binding
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Green fluorescent protein; GFP; steroid receptor; transcription

                                                                                                                                                                                                                                                                                                                                                                                                                                                        inappropriate responses to hormones, for example hormone dependent cancers such as breast, ovarian, and endometrial cancers and prostate cancer. The transgene may also be used to replace a defective gene resulting in such genetic disorders as haemophilia, von Willebrand disease, and cystic fibrosis. Vectors comprising these constructs where the transgene is human clotting factor IX can be used for treating blood clotting disorders such as haemophilia A or B on administration to an organism or to a cellular system. The constructs have applications in gene therapy for treating haemophilia when the transgene encodes a clotting factor such as clotting factor IX. The advantage of this system is that the hormone-hormone receptor complex contains a hormone receptor that becomes activated after binding of its specific hormone. The hormone receptor in the activated state is able to recognise and bind to its specific hormone responsive
                                                                                                                                                                                                                                Query Match

                                                                                                                                                                                                                                                                                                                                                        nucleic acid carrying a transgene encourages binding of a hormone-hormone receptor complex. Thus the activated hormoacts as a link between the nucleic acid carrying the transhormone known to interact with the cell membrane.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The constructs can be used to up-regulate or down-regulate target genes and for the delivery of vaccines. The constructs preferably comprise a transgene which encodes a protein which is lacking in variety of genetic disorders or involved in conditions related in variety of genetic disorders or involved in conditions related in
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   New nucleic acid constructs are described which comprise an hormone responsive element (HRE) and a transgene (T). Alternatively the nucleic acid construct, comprises at least one HRE and a transgene, where one of the HREs is not functionally linked to the transgene;
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          Disclosure; Page 92-95; 100pp; English
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Novel nucleic acid construct useful in gene therapy comprising hormone responsive element and transgene in which the hormone responsive element is not functionally linked to the transgene
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 Hauser-funke
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        (THER-) THERAGENE

The invention relates to a method for modulating activity of a thyroid hormone receptor that comprises administration of an aromatic compound which fits spatially and preferentially into a thyroid hormone ligand binding domain. The aromatic compound (of a specified formula) can be used to increase alpha-glcerophosphate dehydrogenase (GPDH) levels, at levels which do not significantly modify cardiac GPDH levels and are indicated in the treatment of obesity. The compound also lower total plasma cholesterol and triglyceride levels and can be used as anti-hypertriglyceridement. The compound may also be used for treating atherosclerosis and may be indicated in thyroid hormone replacement therapy in patients with compromised cardiac function. Sequences expressed that the compound also be used as a compound and the compound also be used for treating atherosclerosis and may be indicated in thyroid hormone replacement therapy in patients with compromised cardiac function.                                                                                                                                                                                                                      Androgen receptor protein (AR) is used to produce mono- or poly-clonal antibodies. These are used for the detection and quantification of AR in the presence of endogenous androgen, as androgen will not interfere with binding. They may be used in assays to determine and quantify cellular distribution of AR in tumour tissue, and are esp. useful for evaluating prostate cancers to determine responsiveness to androgen withdrawal

                                                                                                                                                                                                                                                                                                                                                                                                                                                          This sequence was deduced from a cDNA clone isolated by screening a rat ventral prostate lambda gtll library in E.coli Y1990. The sequence is very similar to that of human AR and in the DNA-binding domain it is identical to that of hAR DNA-binding domain. Homology comparisons with other known steroid receptors
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               Androgen receptor and TR2 DNA binding proteins - DNA sequences and antibodies for detection and quantification methods
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             rAR; DNA-binding

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    Human androgen receptor (AAW14783) binds testosterone and, acting at the transcriptional level, regulates the growth of normal prostatic cells. Antisense oligonucleotides (see also AAT63200, AAT63404-05) based on an androgen receptor cDNA clone (see also AAT63407) can be used to prevent androgen receptor gene expression, thereby inhibiting the growth or survival of prostatic cells for the treatment of benign prostatic hyperplasia and prostate cancer.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   Disclosure; Page 22-28; 51pp; English

                                                                                                                                                                                                                                                                                                                        This sequence represents the human androgen receptor (AR) amino acid sequence. The invention relates to a fragment of the AR corresponding to a mino acids 234-391 (see AAY78913). The fragment mediates amino acids 234-391 (see AAY78913). The fragment mediates are receptor acts as a transcription factor, regulating the expression of certain androgen responsive genes. Interaction of the AR with the protein kinase and rogen responsive genes. Interaction of the AR with the protein kinase and signal transduction pathway involves interaction with the androgen and signal transduction pathway involves interaction with the androgen according independent activation of the AR fragment and peptides derived from it can be used as agents for inhibiting androgen independent activation of the AR compounds which affect androgen independent activation of the AR. The peptides, when used in combination with androgen deprivation, and as a tool for screening confectively limit androgen mediated disease progression. These diseases and prostatic hyperplasia, hirusutism, androgenic concert. The peptides and nucleic acids encoding them, are especially used for the treatment of androgen mediated disease, and especially used for the treatment of androgen mediated disease.
                                                                                                                                                                                                                         Query Match
